

: DataMigrator for Exchange

Organizations need to maximize e-mail data availability and minimize storage costs. An effective data migration strategy helps reduce server loads, cuts restore times, makes the most efficient use out of new storage as it becomes available and mitigates the impact of growing Microsoft Exchange data stores.

Traditionally, Exchange administrators and users tackled the Information Store (IS) growth issue by periodically

deleting or migrating old (or unwanted) messages. But these attempts to free up mailbox space make it more difficult to manage since those messages end up residing on users' workstations as .PST files. To maintain healthy mailboxes and provide easy access to migrated messages, centralized migration management is a must.

Benefit and Feature Highlights

- Simple to use – single, unified browser interface
- Saves disk capacity and costs – moves unused data to secondary storage
- Improves user productivity – relieves Mailbox Quota interruptions
- Lowers risk – uses Exchange security to ensure proper access to recalled e-mail
- Increases System Admin productivity – policies automate migration
- Integrates with Galaxy backup and recovery software

Unmatched Data Management and Availability

Qinetix™ DataMigrator™ leverages CommVault's comprehensive

Microsoft data

management experience to manage and retain vital messaging and collaboration information. With DataMigrator's robust migration and tracking capabilities, you maximize data management and availability.

DataMigrator lets you manage the size of the Exchange IS so that its capacity is predictable. Regular migration of e-mail effectively keeps the IS at a "steady state," eliminating resource upgrades to handle growth. This means reduced backup windows, decreased use of primary disk storage, improved Exchange Server performance – all while retaining native Exchange security to ensure proper access. By automating migration and shrinking the size of the IS, you lower Total Cost of Ownership. With its enterprise media management, you can migrate data to any media type – disk, tape or optical secondary storage media. Auxiliary copies of migrated data are available for offsite archiving.

Easy E-mail Management and Administration

With DataMigrator, administrators can meet operational requirements through a single, unified browser interface. The software provides flexible and robust retention options, letting administrators fine-tune the system to match their needs. Based on pre-determined criteria, DataMigrator automatically migrates messages and replaces them with stubs that give users recall information.

Migrated data appears in the Outlook interface with a special icon alerting mail users that the message or attachment has been migrated. Recalling migrated data is easy – mail users simply click on the message and it's automatically recalled from storage. Or, IT administrators can use the browser interface to search message attributes before recalling it.

Efficient Storage Utilization

Are you heading toward a mailbox capacity crisis? Are users hitting disk quota limits? Or, is your e-mail server running out of disk space? With DataMigrator, you can automatically migrate data when user quotas are reached. With this perceived "inbox expansion," users are more productive – they now can access more data very simply without managing the size of their inboxes. By controlling the growth of the Exchange Server, there are less "Quota Interruptions."

Qinetix DataMigrator integrates tightly with CommVault® Galaxy™ backup and recovery software to simply manage the entire life cycle of Microsoft Exchange data, as well as dynamically share storage resources (disk, tape, even individual drives).

CommVault® Qinetix™ (kī-nēt' īks) is a single, automated platform that manages and moves data based on its attributes and storage environment. Based on CommVault's Common Technology Engine, it integrates data protection, availability, migration, storage resource and SAN management software solutions. Customers can deploy individual products or seamlessly integrate new elements into an existing CommVault solution, at a fraction of the time, effort and money required by separate point products.

: High Performance

Feature

Controls growth of Information Store

Can filter mailboxes and folders

Flexible migration policies

Browse all migrated mail per Exchange Server

Benefit

Faster Exchange Server performance and improved data access.

Moves only data desired, thereby saving migration time, backup media space and CPU cycles.

Ensures data management strategy meets organizational needs.

Eliminates searching tape sets. Vastly improves and simplifies browsing across Information Stores and Storage Group.

: Data Availability

Feature

Seamless extension of mailboxes eliminates quota interruption

Centralized migration policies replace .PST files

Auto-discovery of mailboxes ensures accurate and complete data migration scheme

Automatic restart of migration jobs

Benefit

Reduces user e-mail management tasks and ensures access.

Establishes corporate-wide retention and migration policies.

Ensures every mailbox will be migrated. New users will not be inadvertently left unmigrated.

Saves time and ensures data migration completes.

: Simple to Use

Feature

Single, unified browser interface

Browse and FIND individual mailboxes, folders and subfolders with context-based search across Storage Groups

No client side software to deploy

Right "Power" click shortcuts in browser interface or choose MMC snap-in

Benefit

Provides a management strategy that's portable, complete and centralized.

Lets administrators quickly locate correct data to meet organizational requirements.

Saves time and speeds deployment of organization-wide solution.

Improves administrator efficiency, saves time and ensures administrative tasks completed accurately.

: Seamless Architecture

Feature

Integrated with CommVault® Galaxy™ backup and recovery solution

Logical, as opposed to physical, view of the enterprise libraries and applications

Total media management capabilities

Benefit

Shares storage resources dynamically and seamlessly.

Dramatically reduces acquisition, deployment and administration of complete data management solution.

Provides improved management across different physical entities, such as servers and applications, as well as easy grouping of like entities.

Enterprise control of libraries, drives and media that's comprehensive, automated and transparent.
